

After remove ver.1.2.12 500 Internal Server Erro

Posted by user3244 - 2011/07/18 21:40

I try to remove the version 1.2.12 in order to upgrade to the last one and after remove the component my website comes down with a:

500 Internal Server Error Fatal Error was detected! Please contact the site owner.

I need to install the 1.2.12 again and my website comes back again.

My question is:

How to upgrade?

also i have 2 days that I order and pay for the pro version and never receive any key

please help

thanks in advance

Hi,

you need to remove modules first.

I also sent you the correct license key via ticketing system.

Thanks,

I not receive any email about ticketing service (I verify my spam folder), also where here in the page I can see my opened tickets in order to see the key?

Yes, just follow the support link from left menu on codegravity.com, there is other link pointing you to the

ticket history.

Soon I will introduce the new way how to pair payments with the license key. I'm also tired with the way how it is now. Thank you for your understanding. I hope the license key will work. I'm here to resolve these problems until the new way will be finished.
